~~Enthalpy of Solution – Chemistry LibreTexts~~

The enthalpy of solution, enthalpy of dissolution, or heat of solution is the enthalpy change associated with the dissolution of a substance in a solvent at constant pressure resulting in infinite dilution. The enthalpy of solution is most often expressed in kJ/mol at constant temperature. The energy change can be regarded as being made of three parts, the endothermic breaking of bonds within the solute and within the solvent, and the formation of attractions between the solute and the solvent.

The heat that the chemical reaction puts out, or takes up, (q_{rxn}) is simply the moles of the limiting reagent, $n_{limiting}$ reagent times ΔH_{rxn} (recall that this is how an enthalpy change was defined), as given by Eqn. 2. $q_{rxn} = n_{limiting} \cdot \Delta H$ (2)

An integral enthalpy of solution, $\Delta H(\text{sol})$, is the enthalpy change for a process in which a finite amount n of solute is transferred from a pure solute phase to a specified amount of pure solvent to form a homogeneous solution phase with the same temperature and pressure as the initial state.

Usually, the enthalpy of dilution of a component in a solution is expressed in terms of energy per amount of substance. However, this quantity can also be expressed in terms of energy per unit mass. The most common units used to express enthalpy of dilution are joules per mole (J/mol) and kilojoules per mole (kJ/mol).

Heat of Solution Enthalpy changes also occur when a solute undergoes the physical process of dissolving into a solvent. Hot packs and cold packs (see Figure below) use this property. Many hot packs use calcium chloride, which releases heat when it dissolves according to the equation below.
